

Let that sink in

If we were to fully use the world's forest's natural carbon potential, how far could we offset future CO2 emissions? Mo and colleagues estimates that the global forest carbon storage is 328 Gt (likely between 221 and 472 Gt). If we were to (somehow) fully use the potential of the world' s forests, we could offset 8 years (most likely between 5.5 and 11.5 years) of future CO2 emissions if they continue at the current pace.
